

Small Market Business Dataset Report

1:Title And Collection Method

Title: Small Market Business Sales Dataset

Collection Method

this dataset was collected from a small market business. It contains information about (Product Category, Product Price, Customer Per Day, Items sold , Day Type, Profitable)

The dataset is to understand to Data science including collection , structure, and preparation of machine learning Classification tasks

2: Description of Features And labels

This dataset contains about Small Business

the following are the features used in the dataset

1. Input Variables (Features X):

- Product Category: type of category(Clothes, Cosmetics, shoes)
- Product price: price of product
- Customer Per Day: the number of customer who visit each day
- Day Type: type of day (weekday or weekend)
- Item Sold: the number of units sold per day

2. Output Variable (Label Y):

- profitable: whether the product generates profit or not (Yes or No)

the label (profitable) is the target variable that can be predicated using features

3:Dataset Structure

This dataset contains:

- Number of samples(Rows):50
- Number of columns:6

Columns:

- 1. Product Category
- 2. Product Price
- 3. Customers Per Day
- 4. Day Type
- 5. Item Sold
- 6. Profitable

Product category	product Price	Customer Per Day	Day Type	Item Sold	Profitable
Clothes	5\$	50	weekday	45	Yes
Cosmetics	2	8	weekday	5	Yes
Shoes	5	10	weekday	4	No

4: Quality issue

the dataset may contain several quality issue that could effect the accuracy of data science and machine learning models.

These issues include:

- missing values in some records
- duplicate records that may effect analysis results
- inconsistent day type (e.g. weakday or weekday)

this dataset , missing value or major inconsistent were found

5: Learning Problem

this dataset represented is a supervised learning Classification problem

because it contains target label called profitable with two possible outcomes: YES OR NO.

The objective is to trains a model that can learn patterns from input features such as Product Category, Product Price, Customer Per Day, Items sold , Day Type and then predict whether a business day will be Profitable.

6: Use Case

This dataset can be used to build a machine learning model that predicts whether a small business will be profitable. Business owners can be can be use these predictions to improves sales strategies and decision-making.

Data Science Life Cycle Stage:

this dataset mainly focused on data collection stage of Data Science . After that the data will be cleaning , evaluated , model. this dataset was collect from small market business and prepared for future machine learning analysis.

Conclusion:

this project demonstrates how data collection can support better business and serve as foundation for future machine learning.
